Jupiter Referral Program

Referral Program

📄 Copy page ▼

Earn on-chain fees from user trades through the open-source Jupiter Referral Program.

The Referral Program is an open-source on-chain program that lets developers earn fees through Jupiter API integrations. It supports Swap API, Trigger API, and Plugin. Any Solana program can also integrate the Referral Program to share revenue with its own integrators.

[Open Source Repository](#): To understand and make use of the referral program better.

Jupiter API Integrators

The Jupiter Programs use the Referral Program to allow developers to earn fees when integrating with Jupiter. Below are some resources to help you quickly get started. There are a different ways to setup such as via the Jupiter Referral Dashboard or using the provided scripts.

- [Jupiter Referral Dashboard](#): To view and manage your referral accounts used with Jupiter APIs.
- [Add Fees to Swap API](#): To add fees to your Swap API integration.
- [Add Fees to Jupiter Plugin](#): To add fees to your Plugin integration.

Project Usage

If you have a project/product that runs a program on the Solana blockchain, you can integrate the Referral Program to allow/share revenue with the integrators of your program.

>

Similar to how Jupiter Programs uses the Referral Program to help developers earn fees and/or share the revenue with Jupiter. For example, Jupiter Ultra uses the Jupiter Swap program which relies on the Referral Program.

- Create a `Project` by calling `initialize_project` with your chosen `base` key and a `project_name` (`base` key refers to a key identifier of your project).
- Set a `default_share_bps` to share the fees with your referrers (or integrators).
- An example of a `Project` account: [Jupiter Ultra Project](#)

Referrer Usage

If you are a referrer such as a developer or integrator of a project that runs a program on the Solana blockchain, you can create the necessary accounts via the Referral Program to earn fees.

- The program must be integrated with the Referral Program.
- Create a `Referral` account by calling `initialize_referral_account` with the correct `Project` account, the `Referral` account, and your own `Partner` account (`Partner` account is the admin of this referral account).
- Create the necessary `Referral` token accounts for the `Referral` account to receive fees in.
